STUDY PURPOSE

The Healthy Minds Study provides a detailed picture of mental health and related issues in college student populations. Schools typically use their data for some combination of the following purposes: to identify needs and priorities; benchmark against peer institutions; evaluate programs and policies; plan for services and programs; and advocate for resources.

STUDY DESIGN

The Healthy Minds Study is designed to protect the privacy and confidentiality of participants. HMS is approved by the Health Sciences and Behavioral Sciences Institutional Review Board at University of Michigan. To further protect respondent privacy, the study is covered by a Certificate of Confidentiality from the National Institutes of Health.

SAMPLING

Each participating school provides the HMS team with a randomly selected sample of currently enrolled students over the age of 18. Large schools typically provide a random sample of 4,000 students, while smaller schools typically provide a sample of all students. Schools with graduate students typically include both undergraduates and graduate students in the sample.

DATA COLLECTION

The HMS is a web-based survey. Students are invited and reminded to participate in the survey via emails, which are timed to avoid, if at all possible, the first two weeks of the term, the last week of the term, and any major holidays. The data collection protocol begins with an email invitation, and non-responders are contacted up to three times by email reminders spaced by 2-4 days each. Reminders are only sent to those who have not yet completed the survey. Each communication contains a URL that students use to gain access to the survey.

NON-RESPONSE ANALYSIS

A potential concern in any survey study is that those who respond to the survey will not be fully representative of the population from which they are drawn. In the HMS, we can be confident that those who are invited to fill out the survey are representative of the full student population because these students are randomly selected from the full list of currently enrolled students. However it is still possible that those who actually complete the survey are different in important ways from those who do not complete the survey. The overall participation rate for the fall 2016 study was 27%. It is important to raise the question of whether the 27% who participated are different in important ways from the 73% who did not participate. We address this issue by constructing non-response weights using administrative data on full student populations. All of the 9 schools in the fall 2016 HMS were able to provide administrative data about all randomly selected students. The analysis of these administrative data, separated from any identifying information, was approved in the IRB application at the University of Michigan and at each participating school. We used the following variables, when available, to estimate which types of students were more or less likely to respond: gender, race/ethnicity, academic level, and grade point average. We used these variables to estimate the response propensity of each type of student (based on multivariate logistic regressions), and then assigned response propensity weights to each student who completed the survey. The less likely a type of student was to complete the survey, the larger the weight they received in the analysis, such that the weighted estimates are representative of the full student population in terms of the administrative variables available for each institution. Finally, note that these sample weights give equal aggregate weight to each school in the national estimates. An alternative would have been to assign weights in proportion to school size, but we decided that we did not want our overall national estimates to be dominated by schools in our sample with very large enrollments.
ABOUT THIS REPORT

This data report provides descriptive statistics (percentages, mean values, etc.) from the sample of respondents at your institution for a set of key measures.

EXPLORING YOUR DATA FURTHER

There are two options for exploring your data beyond what is in this report. First, you can use statistical software (e.g., SPSS, Stata, etc.) to analyze the full data set for your students, which has been provided to your school. Second, you will eventually be able to log on to a user-friendly website with drop-down menus, at data.healthymindsnetwork.org, or email us at healthyminds@umich.edu to request the full national data sets.
# KEY FINDINGS

This section offers a quick look at results that may be of special interest to your institution.

PREVALENCE OF MENTAL HEALTH PROBLEMS

DEPRESSION SCREEN

Depression is measured using the Patient Health Questionnaire-9 (PHQ-9), a nine-item instrument based on the symptoms provided in the Diagnostic and Statistical Manual for Mental Disorders for a major depressive episode in the past two weeks (Spitzer, Kroenke, & Williams, 1999). Following the standard algorithm for interpreting the PHQ-9, symptom levels are categorized as major depression, other depression (less severe depression such as dysthymia or depression not otherwise specified), or neither.

- Major depression: 7%
- Other depression: 15%
- Any depression: 22%

ANXIETY SCREEN

Anxiety is measured using the GAD-7, a seven-item screening tool for screening and severity measuring of generalized anxiety disorder in the past two weeks (Spitzer, Kroenke, Williams, & Lowe, 2006). Following the standard algorithm for interpreting the GAD-7, symptom levels are categorized as severe anxiety, moderate anxiety, or neither.

- Severe anxiety: 7%
- Moderate anxiety: 13%
- Any anxiety: 20%

EATING DISORDER SCREEN

Eating disorders are measured using the written U.S. version of the SCOFF, a five-item screening tool designed to identify subjects likely to have an eating disorder (Morgan, Reid, & Lacey, 1999).

- Eating disorders: 7%

</tbody>
</table>

**POSITIVE MENTAL HEALTH**

Positive mental health (psychological well-being) is measured using The Flourishing Scale, an eight-item summary measure of the respondent’s self-perceived success in important areas such as relationships, self-esteem, purpose, and optimism (Diener, Wirtz, Tov, Kim-Prieto, Choi, Oishi, & Biswas-Diener, 2009). The score ranges from 8-56, and we are using 48 as the threshold for positive mental health.

ATTITUDES AND BELIEFS ABOUT MENTAL HEALTH SERVICES

KNOWLEDGE

Knowledge of campus mental health resources
If I needed to seek professional help for my mental or emotional health, I would know where to go on my campus.

Perceived Need (past year)
In the past 12 months, I needed help for emotional or mental health problems such as feeling sad, blue, anxious or nervous.

Perceived Need (current)
I currently need help for emotional or mental health problems such as feeling sad, blue, anxious or nervous.
## USE OF SERVICES

### Psychotropic medication use, all students (past year)

In the past 12 months have you taken any of the following types of medications? Please count only those you took, or are taking, several times per week. (Select all that apply)

<table>
<thead>
<tr>
<th>Percentage</th>
<th>Medications</th>

Mental health counseling/therapy, all students (past year)

In the past 12 months have you received counseling or therapy for your mental or emotional health from a health professional (such as psychiatrist, psychologist, social worker, or primary care doctor)?

27%

Mental health counseling/therapy among students with positive depression or anxiety screens (past year)

How many total visits or sessions for counseling or therapy have you had in the past 12 months?

39% Has had past year therapy
61% No past year therapy

Mental health counseling/therapy, all students (any therapy)

Have you ever received counseling or therapy for mental health concerns?

44%

Mental health counseling/therapy among students with positive depression or anxiety screens (any therapy)

Have you ever received counseling or therapy for mental health concerns?

58%

Informal help-seeking

In the past 12 months have you received counseling or support for your mental or emotional health from any of the following sources? (Select all that apply)

12% Roommate
45% Friend (who is not a roommate)
39% Significant other
37% Family member
4% Religious counselor or other religious contact
2% Support group
1% Other non-clinical source
32% None of the above

Barriers to help-seeking

In the past 12 months, which of the following factors have caused you to receive fewer services (counseling, therapy, or medications) for your mental or emotional health than you would have otherwise received? (Select all that apply)

2% I haven’t had the chance to go but I plan to
36% No need for services
19% Financial reasons (too expensive, not covered by insurance)
43% Not enough time
9% Not sure where to go
13% Difficulty finding an available appointment
15% Prefer to deal with issues on my own or with support from family/friends
7% Other
16% No barriers
