Recommended Methods of Euthanasia: Guinea Pigs

Species	Method	Description
Guinea Pigs	Asphyxiation using CO2 followed by bilateral thoracotomy.	Using a non-precharged chamber, CO2 is dispensed from a commercial cylinder with fixed pressure regulator and inline restrictor controlling gas flow within 30%-70% of the chamber volume per minute to comply with 2020 AVMA Guidelines. CO2 flow will be maintained for > 60 seconds following respiratory arrest (which may take up to 5 minutes), followed by bilateral thoracotomy to assure euthanasia.
	Asphyxiation using CO2 followed by decapitation.	Using a non-precharged chamber, CO2 is dispensed from a commercial cylinder with fixed pressure regulator and inline restrictor controlling gas flow within 30%-70% of the chamber volume per minute to comply with 2020 AVMA Guidelines. CO2 flow will be maintained for > 60 seconds following respiratory arrest (which may take up to 5 minutes), followed by decapitation using (indicate equipment used) to assure euthanasia.
	Asphyxiation using CO2 followed by exsanguination.	Using a non-precharged chamber, CO2 is dispensed from a commercial cylinder with fixed pressure regulator and inline restrictor controlling gas flow within30%-70% of the chamber volume per minute to comply with 2020 AVMA Guidelines. CO2 flow will be maintained for > 60 seconds following respiratory arrest (which may take up to 5 minutes), followed by rapid exsanguination via (indicate method or vascular incision points) to assure euthanasia.
	Asphyxiation using CO2 followed by major organ harvest.	Using a non-precharged chamber, CO2 is dispensed from a commercial cylinder with fixed pressure regulator and inline restrictor controlling gas flow within 30%-70% of the chamber volume per minute to comply with 2020 AVMA Guidelines. CO2 flow will be maintained for > 60 seconds following respiratory arrest (which may take up to 5 minutes), followed by rapid harvest of (indicate organs / tissues) to assure euthanasia.
	Inhalant anesthetic overdose followed by bilateral thoracotomy.	Using a precision vaporizer with induction chamber and waste gas scavenger, (indicate the gas anesthetic) will be administered slowly up to [indicate: > 4.5 % (for Isoflurane) or > 6.5 % (for Sevoflurane)] in oxygen and continued until respiratory arrest occurs for > 60 seconds. The chamber is flushed with oxygen only, the animal is removed and bilateral thoracotomy is performed to assure euthanasia.
	Inhalant anesthetic overdose followed by decapitation.	Using a precision vaporizer with induction chamber and waste gas scavenger, (indicate the gas anesthetic) will be administered slowly up to [indicate: > 4.5 % (for Isoflurane) or > 6.5 % (for Sevoflurane)] in oxygen and continued until respiratory arrest occurs for > 60 seconds. The chamber is flushed with oxygen only, the animal is removed and decapitated with (indicate equipment used) to assure euthanasia.
	Inhalant anesthetic overdose followed by exsanguination.	Using a precision vaporizer with induction chamber and waste gas scavenger, (indicate the gas anesthetic) will be administered slowly up to [indicate: > 4.5 % (for Isoflurane) or > 6.5 % (for Sevoflurane)] in oxygen and continued until respiratory arrest occurs for > 60 seconds. The chamber is flushed with oxygen only, the animal is removed and rapid exsanguination is performed by (indicate method or vascular incision points) to assure euthanasia.
	Inhalant anesthetic overdose followed by major organ harvest.	Using a precision vaporizer with induction chamber and waste gas scavenger, (indicate the gas anesthetic) will be administered slowly up to [indicate: > 4.5 % (for Isoflurane) or > 6.5 % (for Sevoflurane)] in oxygen and continued until respiratory arrest occurs for > 60 seconds. The chamber is flushed with oxygen only, the animal is removed and rapid removal of (indicate tissues / organs) is performed to assure euthanasia.
	Inhalant anesthetic overdose (dessicator jar) followed by bilateral thoracotomy.	Using a dessicator jar in a chemical fume hood, the animal is placed on a perforated platform that prevents direct contact with the liquid anesthetic (<i>indicate the gas anesthetic</i>). The lid is replaced and the animal monitored until lack of respiration for > 60 seconds is observed. The animal is removed from the jar and bilateral thoracotomy is performed to assure euthanasia.

Recommended Methods of Euthanasia: Guinea Pigs

Species	Method	Description
	dessicator jar) followed by decapitation.	Using a dessicator jar in a chemical fume hood, the animal is placed on a perforated platform that prevents direct contact with the liquid anesthetic (<i>indicate the gas anesthetic</i>). The lid is replaced and the animal monitored until lack of respiration for > 60 seconds is observed. The animal is removed from the jar and decapitated with (<i>state equipment used</i>) to assure euthanasia.
	dessicator jar) followed by exsanguination.	Using a dessicator jar in a chemical fume hood, the animal is placed on a perforated platform that prevents direct contact with the liquid anesthetic (<i>indicate the gas anesthetic</i>). The lid is replaced and the animal monitored until lack of respiration for > 60 seconds is observed. The animal is removed from the jar and exsanguination performed by (<i>indicate method or vascular incision points</i>) to assure euthanasia.
	dessicator jar) followed by major organ	Using a dessicator jar in a chemical fume hood, the animal is placed on a perforated platform that prevents direct contact with the liquid anesthetic (<i>indicate the gas anesthetic</i>). The lid is replaced and the animal monitored until lack of respiration for > 60 seconds is observed. The animal is removed from the jar and (<i>state tissues / organs</i>) are harvested to assure euthanasia.
	anesthesia	(Indicate drug, dose in mg/kg, route & gauge needle) will be used to induce anesthesia. Surgical depth of anesthesia will be verified by lack of response to (indicate stimulus) stimulus. Vital perfusion will be performed using (indicate name) perfusate injected into the (define point of vascular access or blood egress site). Perfusion will be performed in a chemical fume hood if required by EHS. Perfusate waste will be disposed of by (indicate method of disposal).
		Administration of \geq 100mg/kg of Pentobarbital (<i>state manufacturer</i>) intraperitoneal (IP) or intravascular (IV). Monitor animal until lack of heart beat is noted for \geq 60 seconds prior to tissue harvest or carcass disposal.
